BUSINESS REQUIREMENTS DOCUMENT

BeOne POC

Feature Summaries
Prepared by Kolosal AI

Version 1.0 · October 30, 2026 · Draft · Internal

List of Features

22 features

1. 05 - ICF Creation - Edit and Refine
2. 06 - ICF Creation - Review
3. 07 - ICF Creation - Preview
4. 02 - ICF Dashboard
5. 01 - Onboarding
6. 03 - ICF Creation - Setup
7. 04 - ICF Creation - Generate
8. Progress Stepper
9. Wrapper Shell
10. Table of Contents
11. Global Navigation Header
12. Bottom Bar - Setup
13. Bottom Bar - Review
14. Bottom Bar - Edit
15. Bottom Bar - Generate
16. AI Document Parser
17. AI Openrouter SDK
18. AI Document Editor
19. Edit Actions
20. Review Actions
21. Comment Actions
22. New Canvas

BUSINESS REQUIREMENTS DOCUMENT

05 - ICF Creation - Edit and Refine

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. Frontend

1.1 Overview

The "Edit and Refine" feature provides a user-friendly interface for reviewing and polishing Informed Consent Form (ICF) documents generated by AI. It allows users to view the document in organized sections, make manual adjustments, and leverage AI assistance to rewrite or improve specific parts of the text. This ensures that the final document is accurate, professional, and tailored to specific study requirements.

1.2 Step-by-Step Flow

1. Document Loading: Upon entering the editor, the system automatically retrieves the generated ICF and displays it as a series of organized cards.
2. Section Review: You can scroll through the document, where each section is clearly labeled with its title and number. Sections created by the AI are marked with a specific badge for easy identification.
3. Initiating Edits: When you identify a section that needs refinement, you can select the "Edit with AI" button on that specific card.
4. Manual Refinement: A dedicated editing window opens, displaying the current text. You can manually type, delete, or rewrite the content directly in this area.
5. AI Processing: If you choose to use AI assistance, the system will process your request and update the section. During this time, a visual indicator will appear to let you know the system is working on the update.
6. Progress Tracking: Throughout the process, a progress bar at the top of the screen keeps you informed of your current stage within the overall ICF creation workflow.

1.3 Key Concepts

- Section-Based Editing: The document is broken down into manageable chunks, allowing you to focus on one part of the ICF at a time rather than the entire document at once.
- AI-Assisted Refinement: A tool that allows you to combine your human expertise with AI capabilities to rewrite or improve the clarity and tone of the document.
- Visual Status Indicators: Clear markers (such as badges and loading spinners) that help you distinguish between AI-generated content and your own edits, and show you when the system is actively processing changes.
- Workflow Progress: A navigation guide that shows you exactly where you are in the four-step ICF creation process, ensuring you know what has been completed and what remains.

1.4 Business Value

This feature significantly reduces the time and effort required to finalize complex legal and medical documents. By providing a hybrid approach—where the AI handles the heavy lifting of drafting and the user maintains full control over the final content—the organization can ensure high-quality, compliant ICFs are produced faster. This minimizes manual errors, improves consistency across documents, and allows staff to focus on high-level review rather than repetitive drafting tasks.

2. Logic

2.1 Overview

This feature enables the system to retrieve and display the full details of an Informed Consent Form (ICF) whenever a user opens a document for review or editing. By automatically loading the document's content, metadata, and current status, the system ensures that users always have the most up-to-date version of the form ready for refinement.

2.2 Step-by-Step Flow

1. Initiation: When a user navigates to the document editing screen, the system automatically triggers a request to fetch the specific document.
2. Data Retrieval: The system searches the database for the document record associated with the unique ID of the selected file.
3. Validation: The system confirms the document exists. If the document cannot be found, an error message is displayed to the user.
4. Display: Once located, the system pulls the full document record—including its name, version, current status, and the actual text content—and populates the editing interface so the user can begin their work.

2.3 Key Concepts

- Document Metadata: The background information about the file, such as its name, version number, and the dates it was created or last modified.
- Document Status: The current state of the ICF (e.g., draft, under review, or published), which helps users understand where the document is in the lifecycle.
- Primary Read Endpoint: The standard "fetch" action the system performs to ensure the screen is populated with accurate, real-time information every time a user opens a document.

2.4 Business Value

This feature provides a seamless user experience by ensuring that the editing environment is instantly populated with the correct document data. By automating the retrieval process, it eliminates the need for manual searching or

refreshing, allowing users to focus immediately on the task of reviewing and refining the ICF content. This reliability is essential for maintaining accuracy and efficiency in the document management workflow.

3. Data

3.1 Overview

The ICF Creation - Edit and Refine feature provides a robust environment for users to review, adjust, and finalize Informed Consent Forms (ICFs). This feature acts as the foundation for document management, ensuring that once an ICF is generated, users have a reliable way to retrieve the document's current state, including its text content, version history, and associated metadata, so they can perform manual edits or trigger AI-assisted refinements.

3.2 Step-by-Step Flow

1. Document Retrieval: When a user selects an ICF to edit, the system fetches the specific document using its unique identifier.
2. Data Loading: The system retrieves the full document profile, which includes the document name, current version, status, and the actual text content.
3. Metadata Access: The system loads additional background information (metadata) associated with the document, such as tracking details or specific configuration settings.
4. Display for Refinement: The retrieved information is presented in the interface, allowing the user to view the current draft and begin the editing or refinement process.
5. Error Handling: If the document cannot be found or if there is a system issue during retrieval, the user is notified immediately to ensure data integrity.

3.3 Key Concepts

- Document Profile: The complete set of information regarding an ICF, including its title, version number, and current status (e.g., draft or published).
- Metadata: Supplemental information attached to the document that helps track its history and specific attributes without cluttering the main document text.
- Version Control: The ability to track different iterations of the ICF, ensuring users are always editing the correct and most recent version.
- Read-Only Retrieval: A secure process that ensures the document is safely loaded into the editor without accidentally modifying the source data until the user explicitly saves their changes.

3.4 Business Value

This feature streamlines the document lifecycle by providing a reliable "single source of truth" for ICFs. By enabling seamless retrieval and display, it reduces the time spent searching for document versions and ensures that clinical teams can confidently refine content. This leads to higher quality documentation, improved compliance, and a more efficient workflow for preparing consent forms.

BUSINESS REQUIREMENTS DOCUMENT

06 - ICF Creation - Review

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. Frontend

1.1 Overview

The ICF Review feature provides a dedicated workspace for stakeholders to examine, discuss, and refine draft Informed Consent Forms (ICFs). This interface allows users to view the document structure, track changes, and collaborate through comments, ensuring that all feedback is captured and addressed before the document is finalized.

1.2 Step-by-Step Flow

1. Review Actions: Access the edit bar to compare different versions of the document, allowing you to see how the content has evolved.
2. Comment Actions: Use the dedicated comments panel on the right to view feedback from reviewers or add your own notes directly to the document.
3. Progress Stepper: Monitor your current stage in the document creation process via the visual progress indicator.
4. Audit Trail: Review the chronological history of the document, including all edits, comments, and AI-generated updates, clearly marked by the person or system that performed the action.
5. Global Navigation: Use the top header to manage your profile and navigate the platform.
6. Bottom Bar: Utilize the persistent footer to perform final review actions and move the document forward.
7. Wrapper Shell: View essential document metadata, such as the protocol name and ID, displayed in the main layout.
8. Table of Contents: Use the left-hand navigation panel to jump quickly to specific sections of the document.
9. Document Section Cards: Read the document content, which is organized into clear, individual cards. Each card identifies whether the content was AI-generated, ensuring transparency in how the draft was created.

1.3 Key Concepts

- Audit Trail: A complete, time-stamped record of all activity on the document, helping teams maintain accountability and transparency.
- Section Cards: A modular way of displaying document content that makes long forms easier to read and review.
- AI-Generated Badge: A visual indicator that highlights content drafted by the system, allowing reviewers to focus their attention on verifying AI-assisted sections.
-

Version Comparison: The ability to view changes between different drafts to ensure that previous feedback has been correctly incorporated.

1.4 Business Value

This feature streamlines the document approval process by centralizing communication and history. By providing a clear view of AI-generated content alongside human feedback, it reduces the time spent on manual reconciliation, minimizes errors in the consent process, and ensures that all stakeholders are aligned on the final version of the document.

2. Logic

2.1 Overview

The ICF Review feature provides a transparent and organized way for users to manage the document approval process. It allows reviewers and authors to see the current state of an Informed Consent Form (ICF) and access a complete, chronological history of all actions taken on that document. This ensures that feedback, status changes, and document updates are tracked clearly, making it easy to incorporate reviewer comments and maintain accountability throughout the drafting process.

2.2 Step-by-Step Flow

1. Document Retrieval: The system loads the specific ICF draft, displaying its current status, metadata, and content so the user can review the latest version.
2. Audit Trail Access: The system retrieves the full history of the document, including every action taken by users.
3. Chronological Display: The system organizes these actions from newest to oldest, ensuring the most recent feedback or status updates appear at the top.
4. Review and Action: The user reviews the document content alongside the audit history to understand previous feedback and incorporate necessary changes.

2.3 Key Concepts

- Audit Trail: A comprehensive, time-stamped record of all activities related to a document, such as who viewed it, who provided feedback, and when the status changed.
- Document Metadata: Essential information about the ICF, including its name, current version, and last modified date, which helps users identify the correct draft.
- Chronological Feed: A list of events sorted by time, allowing users to follow the "story" of the document's development from start to finish.

2.4 Business Value

- Accountability: By maintaining a tamper-evident history of all actions, the organization can ensure full traceability for compliance and regulatory requirements.
- Efficiency: Reviewers and authors can quickly understand the document's history and see exactly what feedback has been provided, reducing the time spent searching for context.
- Transparency: Providing a clear view of status transitions and user comments minimizes confusion during the review cycle, leading to faster and more accurate document finalization.

3. Data

3.1 Overview

The ICF Review feature allows you to access and evaluate the current draft of an Informed Consent Form (ICF). This tool provides a clear view of the document's status and a detailed history of all changes and feedback provided by reviewers. By centralizing the document content and its activity log, the system ensures that you can easily track the evolution of the document and incorporate necessary feedback to finalize the draft.

3.2 Step-by-Step Flow

1. Document Retrieval: The system pulls the specific ICF draft you wish to review, ensuring you are looking at the most current version of the document content and its associated metadata.
2. Activity Review: The system retrieves the audit trail for that specific document.
3. Chronological Feed: The audit logs are displayed in a timeline format, starting with the most recent actions and comments, allowing you to see exactly what feedback was provided and by whom.
4. Feedback Incorporation: Using the document content and the insights from the audit trail, you can address reviewer comments and update the document as needed.

3.3 Key Concepts

- ICF Document: The core file containing the consent information, including its current version, status, and the actual text that requires review.
- Audit Trail: A chronological record of all actions taken on the document, which serves as the primary source for tracking reviewer feedback and history.
- Metadata: Background information attached to the document that helps identify its version, creation date, and last modification time.
- Chronological Timeline: A view that organizes activity logs from newest to oldest, ensuring the most recent feedback is always at the top for immediate attention.

3.4 Business Value

This feature streamlines the document approval process by eliminating the need to hunt for feedback across different channels. By providing a transparent, time-stamped history of all interactions, it reduces the risk of missing critical reviewer comments. This leads to faster turnaround times for ICF drafts, improved accuracy in documentation, and a clear, accountable record of the entire review lifecycle.

BUSINESS REQUIREMENTS DOCUMENT

07 - ICF Creation - Preview

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. Frontend

1.1 Overview

The ICF Preview and Publishing feature provides a final "read-only" view of the Informed Consent Form (ICF) before it is officially finalized. This screen allows users to review the document exactly as it will appear in its final format, ensuring all content, headers, and protocol metadata are correctly organized. Once satisfied, the user can publish the document, which locks the content and marks it as complete.

1.2 Step-by-Step Flow

1. Document Loading: Upon entering the page, the system automatically retrieves the document's metadata and all associated content sections.
2. Visual Review: The document is displayed in a simulated PDF layout, showing the organization header, title, and all numbered sections in their final order.
3. Document Controls: Users can use the toolbar to view the document title and page count, or adjust the view using zoom controls to inspect specific details.
4. Publishing: Once the user confirms the document is correct, they click the "Publish" button.
5. Confirmation: Upon a successful publish, the button is replaced by a success badge, indicating the document is now locked and finalized.
6. Navigation: If the user identifies any errors during the preview, they can select the "Back to Review" button to return to the previous editing stage.

1.3 Key Concepts

- Simulated PDF View: A digital preview that mimics the final printed document layout, allowing users to verify formatting before finalization.
- Publishing: The final action that locks the document content, preventing further edits and creating an official record of the ICF.
- Document Toolbar: A utility area that provides context (such as file name and page count) and viewing tools (zoom) to assist in the review process.
- Progress Stepper: A visual indicator that helps the user understand their current position within the overall ICF creation workflow.

1.4 Business Value

This feature acts as the final quality assurance gate in the ICF creation process. By providing a high-fidelity preview, it reduces the risk of errors in sensitive legal and medical documentation. The ability to lock the document upon

publishing ensures data integrity and provides a clear, auditable status for the document, giving stakeholders confidence that the final version is accurate and ready for distribution.

2. Logic

2.1 Overview

The ICF Preview and Publish feature allows users to review a generated Informed Consent Form (ICF) in a simulated document format before finalizing it. This feature ensures that all document details and content sections are accurately displayed for a final check. Once the user is satisfied with the preview, they can trigger the publishing process, which officially locks the document and records the completion time.

2.2 Step-by-Step Flow

1. Document Loading: When you open the preview page, the system automatically retrieves the document's background information (such as the title and creation date) and all its specific content sections.
2. Review: The system combines this information to display a clear, readable version of the ICF on your screen.
3. Publishing: Once you have reviewed the document and are ready to finalize it, you click the "Publish" button.
4. Finalization: The system sends a request to officially mark the document as published.
5. Confirmation: Upon a successful update, the system replaces the "Publish" button with a "ICF Published Successfully" badge, confirming that the document is now locked and timestamped.

2.3 Key Concepts

- Document Metadata: The high-level information about the form, such as its title, current status, and when it was created.
- Section Content: The specific text and data blocks that make up the body of the Informed Consent Form.
- Publishing: The final action that transitions the document from a draft state to a permanent, finalized record.
- Status Badge: A visual indicator in the user interface that provides immediate feedback on whether the document has been successfully published.

2.4 Business Value

This feature provides a "safety net" for users by allowing them to verify the accuracy of the ICF before it is officially recorded. By separating the preview and publishing steps, the system reduces the risk of errors, ensures compliance through a formal publishing process, and provides clear visual confirmation once a document is finalized.

BUSINESS REQUIREMENTS DOCUMENT

02 - ICF Dashboard

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. Frontend

1.1 Overview

The Consent IQ Dashboard serves as the central command center for managing Informed Consent Forms (ICFs). It provides users with a high-level overview of their consent documentation status and a searchable, sortable list of all protocols. From this hub, users can quickly monitor progress, search for specific documents, and navigate directly to creation, editing, or preview workflows.

1.2 Step-by-Step Flow

1. Dashboard Initialization: Upon loading, the dashboard automatically fetches and displays summary statistics (Total, In Review, and Approved forms) and populates the main data table with all available protocols.
2. Search and Discovery: Users can type into the search bar to instantly filter the list of protocols and ICFs by name. Clearing the search box automatically restores the full list.
3. Sorting: Users can click any column header in the table to sort the data. Clicking a header once sorts the list in ascending order; clicking it again toggles the order to descending.
4. Action Selection: Depending on the status of a specific form, users can interact with the "Actions" column:

* For Drafts or In-Review forms: Users can choose to "View" (to see a preview) or "Open" (to jump into the editing and refinement tool).

* For Approved forms: Users can "View" or "Open" the document to see the final version.

5. Creating New Content: Users can click the "Create New Consent" button in the header to initiate the setup process for a new protocol.

1.3 Key Concepts

- Statistics Cards: High-level summary widgets that provide immediate visibility into the volume of work currently in progress versus completed.
- Sortable Data Table: A dynamic list that allows users to organize information by various criteria (such as Protocol ID, Status, or Last Modified date) to find specific records faster.
- Status-Driven Actions: A smart interface that changes the available options based on the document's current state, ensuring users only see relevant tools (e.g., you cannot "edit" an approved document).
- Instant Search: A responsive search feature that updates the table results in real-time as the user types, reducing the need for manual filtering.

1.4 Business Value

-

Efficiency: Centralizing all consent forms into one dashboard eliminates the need to navigate through multiple systems or folders to find documentation.

- Visibility: Real-time statistics provide leadership and project managers with an immediate pulse on the status of consent forms across all protocols.
- Reduced Administrative Burden: By providing direct, context-aware links to editing and previewing, the dashboard minimizes the time spent searching for the right tool for the right task.
- Improved Data Management: The ability to sort and search large volumes of protocol data ensures that users can maintain control and oversight as the number of projects grows.

2. Logic

2.1 Overview

The ICF Dashboard serves as the central command center for managing consent forms. It provides users with an immediate high-level summary of their workload and offers powerful tools to locate and organize specific consent forms across various research protocols.

2.2 Step-by-Step Flow

1. Dashboard Initialization: When you first open the dashboard, the system automatically retrieves a summary of your consent forms, showing the total number of forms, how many are currently under review, and how many have been approved.
2. Viewing Protocols: The system displays a comprehensive list of all protocols, including key details such as the protocol name, consent form version, current status, and the date of the last update.
3. Sorting Data: You can organize the list of protocols by clicking on column headers (such as status or last modified date) to sort the information in the order that best suits your current task.
4. Searching for Specifics: If you need to find a particular item, you can use the search function to filter the list by entering either the protocol name or the specific name of the consent form.

2.3 Key Concepts

- Dashboard Statistics: A snapshot view that provides immediate visibility into the volume and progress of consent forms.
- Protocol List: The primary table containing detailed records of consent forms, including their identification, versioning, and current status.
- Sorting: A feature that allows you to reorder the list of protocols to prioritize specific information.
-

Filtering: A search capability that narrows down the list of protocols based on specific keywords, helping you quickly locate relevant documents.

2.4 Business Value

This feature streamlines the administrative workflow by eliminating the need to manually track consent forms across different systems. By providing a centralized view with intuitive search and sort capabilities, the dashboard reduces the time spent searching for information, minimizes the risk of missing forms in the review process, and ensures that project managers have real-time visibility into the status of all research protocols.

3. Data

3.1 Overview

The ICF Dashboard serves as the central command center for managing Informed Consent Forms (ICFs). It provides users with a high-level summary of all consent activity and a detailed, searchable list of individual forms. This feature is designed to help you quickly assess the status of your documentation and locate specific protocols without navigating through complex menus.

3.2 Step-by-Step Flow

1. View Summary Statistics: Upon opening the dashboard, the system automatically calculates and displays a snapshot of your ICF portfolio, showing the total number of forms, how many are currently under review, and how many have been approved.
2. Access Detailed Records: The dashboard presents a comprehensive list of all ICFs, including key details like the protocol name, version, current status, and the date of the last update.
3. Search and Filter: You can narrow down the list of forms by entering specific keywords related to a protocol or a specific ICF name.
4. Organize Data: You can sort the list of forms by various criteria (such as status or date) to prioritize the information that is most relevant to your current task.

3.3 Key Concepts

- Dashboard Statistics: A real-time summary that provides immediate visibility into the volume and progress of your consent forms.
- ICF Record: A detailed entry containing all essential metadata for a specific consent form, such as its unique identifier, version history, and current approval status.
- Search and Sort: Tools that allow you to manage large volumes of data by quickly finding specific records or reordering the list to suit your workflow.

3.4 Business Value

This feature streamlines the administrative burden of managing consent forms by providing a "single source of truth." By offering both a high-level overview and granular search capabilities, it reduces the time spent searching for documents, minimizes the risk of missing forms that require attention, and ensures that project teams can maintain clear oversight of their protocol documentation status at all times.

BUSINESS REQUIREMENTS DOCUMENT

01 - Onboarding

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. Frontend

1.1 Overview

The Welcome Screen serves as the personalized landing page for authenticated users within the BeOne platform. It provides a professional, role-aware entry point that confirms the user's identity, displays their current work status, and highlights the platform's value proposition before they proceed to the main dashboard.

1.2 Step-by-Step Flow

1. Loading Phase: Upon arrival, the system displays a full-screen spinner with the message "Signing you in…" while it securely retrieves the user's profile and task data.
2. Data Retrieval: The system automatically fetches the user's name, assigned roles, and current task counts (drafts and reviews) from the server.
3. Visual Presentation: Once loaded, the screen displays a two-column layout:

* Left Column: Features an illustration representing the platform, accompanied by key performance metrics (500+ Protocols, 99% Compliance, 3x Faster).
* Right Column: Displays a personalized welcome message, the user's initials in a circular avatar, their specific roles (color-coded for clarity), and a summary of their pending tasks.

4. Administrative Note: A footer note informs the user that their specific permissions are managed by their organization’s administrator.
5. Navigation: The user clicks the "Continue to Dashboard" button to transition from the welcome screen into the main application workspace.

1.3 Key Concepts

- Role-Awareness: The interface dynamically adjusts to show the user's specific primary and secondary roles, ensuring they have visibility into their functional responsibilities.
- Task Summary: A real-time snapshot of the user's active work, specifically highlighting items currently in progress and those requiring their review.
- Authenticated Landing: A secure, personalized gateway that ensures users are recognized and informed of their status before entering the core dashboard.
- System Feedback: Clear visual indicators (loading spinners and error messages) that keep the user informed about the status of their session.

1.4 Business Value

-

Efficiency: By providing a summary of pending tasks immediately upon login, users can prioritize their work before even reaching the dashboard.

- User Confidence: The personalized welcome and clear display of roles reinforce that the user is in the correct environment with the appropriate access levels.
- Brand Alignment: The inclusion of platform performance metrics (compliance and speed) reinforces the value of the tool to the user every time they log in.
- Administrative Clarity: By explicitly stating how permissions are managed, the system reduces confusion and support inquiries regarding access rights.

2. Logic

2.1 Overview

The Onboarding feature provides a personalized landing page for users immediately after they log in. By identifying who the user is and what their current responsibilities are, the system creates a tailored experience that displays their profile information alongside a summary of their active tasks. This ensures that every user starts their session with a clear view of their status and workload.

2.2 Step-by-Step Flow

1. Identity Verification: The system checks the user's active session to ensure they are securely logged in. If the session is missing or has expired, the user is prompted to log in again.
2. Data Gathering: Once verified, the system retrieves the user’s profile details (such as their name, role, and regional settings) and their current task metrics.
3. Personalized Dashboard Construction: The system compiles this information into a single view, combining identity details with a snapshot of their work progress.
4. Display: The user is presented with their personalized welcome screen, featuring their profile information and a summary of tasks requiring their attention.

2.3 Key Concepts

- Authentication: The security process that confirms the user's identity before granting access to the dashboard.
- User Profile: The collection of personal information, such as name, contact details, and assigned roles, that defines the user within the system.
- Task Summary: A real-time snapshot of the user's current workload, including items in progress, items waiting for review, and items that have been approved or rejected.
-

Role-Awareness: The system’s ability to recognize the user's specific job function, ensuring the information displayed is relevant to their responsibilities.

2.4 Business Value

This feature improves user efficiency by eliminating the need to navigate through multiple screens to understand their current status. By providing an immediate, role-specific overview upon login, the system reduces cognitive load and helps users prioritize their work effectively from the moment they start their session.

3. Data

3.1 Overview

The "Onboarding" feature serves as the personalized landing page for users immediately after they log in. Its primary purpose is to verify the user's identity and instantly gather all the information needed to display a tailored dashboard. By combining profile details with a summary of current work tasks, the system ensures that users see relevant information specific to their role the moment they arrive.

3.2 Step-by-Step Flow

1. Authentication Check: The system verifies the user's identity using their secure login credentials (session cookie or token). If the session is invalid or expired, the user is denied access.
2. Data Retrieval: Once verified, the system automatically fetches the user’s profile information (such as their name, role, and preferences) and their current task status.
3. Dashboard Preparation: The system compiles this data into a single package, which is then sent to the screen to populate the dashboard with the correct user-specific content and work metrics.

3.3 Key Concepts

- Authenticated Session: A secure connection that confirms who the user is, ensuring they only see data they are authorized to access.
- Role-Awareness: The system recognizes the user's specific job function or permissions, allowing it to display features and information relevant to their role.
- Task Summary: A snapshot of the user's current workload, including items in progress, items waiting for review, rejected items, and items ready for publication.
- Personalized Landing: The ability for the software to "greet" the user with their specific profile and work status immediately upon entry.

3.4 Business Value

This feature significantly improves the user experience by eliminating the need for multiple loading screens or manual data refreshes. By "bootstrapping" the dashboard—meaning all essential information is delivered in one go—the system allows users to immediately understand their priorities and jump straight into their work. This reduces friction, saves time, and ensures that every user has a clear, personalized view of their responsibilities from the moment they log in.

BUSINESS REQUIREMENTS DOCUMENT

03 - ICF Creation - Setup

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. Frontend

1.1 Overview

The ICF Creation Setup feature is a guided, three-step wizard designed to help users prepare the necessary information for generating an Informed Consent Form (ICF). By centralizing protocol selection, document management, and template choice into one interface, the system ensures that all required inputs are correctly configured before the AI generation process begins.

1.2 Step-by-Step Flow

1. Protocol Selection: The user begins by selecting a clinical protocol from a list. A search tool is available to quickly filter protocols by name or ID once at least three characters are entered.
2. Document Attachment: Once a protocol is selected, the user attaches essential reference materials, such as the Investigator's Brochure or Lab Manual. Users can either fetch these from the document management system or upload them directly.
3. Template Selection: The user chooses a document template to define the structure of the ICF. A "standard" template is selected by default, but users can choose others based on descriptions and recommendations provided in the interface.
4. Validation and Launch: Throughout the process, the system validates that a protocol is selected before allowing document uploads. Once all steps are complete, the user is ready to trigger the AI generation.

1.3 Key Concepts

- Protocol: The specific clinical study plan that serves as the foundation for the ICF.
- Reference Documents: Supporting files (like brochures or manuals) required to provide accurate information for the ICF.
- Template: A pre-defined document structure that ensures the generated ICF meets specific formatting and content standards.
- Wizard: A step-by-step interface that guides the user through a complex task, ensuring no required information is missed.
- Validation: Automated checks that prevent errors, such as ensuring a protocol is chosen before attempting to attach documents.

1.4 Business Value

This feature streamlines the ICF creation process by replacing manual, fragmented workflows with a single, intuitive interface. By guiding users through the necessary setup steps, it reduces the risk of human error, ensures

consistency across all generated documents, and significantly accelerates the time it takes to prepare an ICF for clinical trials.

2. Logic

2.1 Overview

The ICF (Informed Consent Form) Creation Setup feature provides a guided, three-step wizard designed to help users prepare the necessary information for AI-assisted document generation. By centralizing protocol selection, document management, and template choice, the system ensures that all required inputs are correctly linked before the generation process begins.

2.2 Step-by-Step Flow

1. Protocol Selection: Upon opening the wizard, the system loads a list of available protocols. Users can either browse the full catalog or use a search function (requiring at least three characters) to find a specific protocol by name or ID.
2. Reference Document Management: Once a protocol is selected, the system retrieves any existing reference documents associated with that specific protocol.
3. Document Upload: If additional reference materials are needed, users can upload files (such as PDFs, Word documents, or text files). The system validates the file type and securely stores the document, linking it directly to the selected protocol.
4. Template Selection: The user selects an appropriate ICF template from a pre-defined catalog. This ensures the generated document follows the required organizational standards.
5. Launch: With the protocol, reference documents, and template confirmed, the setup is complete and the user is ready to trigger the AI generation process.

2.3 Key Concepts

- Protocol: The foundational clinical study framework that dictates the requirements for the ICF.
- Reference Documents: Supporting files (like study protocols or background information) that the AI uses as context to generate an accurate ICF.
- Template: A standardized document structure that serves as the starting point for the AI to ensure consistency and compliance.
- Wizard: A user-friendly interface that breaks the setup process into logical, sequential steps to prevent errors and ensure all necessary data is captured.

2.4 Business Value

This feature streamlines the administrative burden of preparing clinical documents. By enforcing a structured workflow, it reduces the risk of missing critical information, ensures that generated documents are always mapped to the correct study protocol, and significantly accelerates the time-to-draft for complex ICFs.

3. Data

3.1 Overview

The ICF (Informed Consent Form) Creation Setup feature is a guided, three-step wizard designed to streamline the preparation of new consent documents. By centralizing the selection of clinical protocols, supporting reference materials, and standardized templates, the system ensures that users have all the necessary information organized before triggering the AI-driven generation process.

3.2 Step-by-Step Flow

1. Protocol Selection: The user begins by searching for and selecting the specific clinical protocol relevant to the new ICF. The system provides details such as the protocol name, phase, and category to ensure the correct study is identified.
2. Reference Document Attachment: Once the protocol is selected, the user uploads or attaches the necessary reference documents. These files are linked directly to the chosen protocol to provide the AI with the context required for accurate document drafting.
3. Template Selection: The user chooses a standardized ICF template from the available catalog. The system highlights "recommended" templates to help the user select the most appropriate format for their specific study requirements.
4. Launch Generation: After the protocol, documents, and template are confirmed, the user initiates the AI generation process to create the draft ICF.

3.3 Key Concepts

- Protocol: The foundational clinical study plan that defines the scope and requirements for the ICF.
- Reference Document: Supporting files (such as study protocols or background materials) that provide the necessary information for the AI to generate a compliant and accurate consent form.
- Template: A pre-defined document structure that ensures consistency and adherence to organizational standards.
- Recommended Template: A system-flagged option that guides the user toward the most suitable template based on the selected protocol.

3.4 Business Value

- Efficiency: By consolidating the setup into a single wizard, users save time by avoiding manual document gathering and formatting.
- Accuracy: Linking reference documents directly to a specific protocol ensures that the AI has the correct context, reducing the risk of errors in the generated consent forms.
- Standardization: Using pre-approved templates ensures that all ICFs produced by the system meet organizational and regulatory quality standards.
- User Guidance: The inclusion of recommended templates simplifies the decision-making process for users, ensuring they choose the best starting point for their specific study.

BUSINESS REQUIREMENTS DOCUMENT

04 - ICF Creation - Generate

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. Frontend

1.1 Overview

The ICF Generation feature provides a transparent, real-time view of the document creation process. When a user initiates the generation of an Informed Consent Form (ICF), the system displays a dedicated dashboard that tracks progress through six specific stages. This ensures users are kept informed about the status of their document without needing to guess how much time remains or what the system is currently doing. Once the process reaches 100% completion, the system automatically transitions the user to the document editor.

1.2 Step-by-Step Flow

1. Initialization: The system launches the generation dashboard, displaying the specific protocol being processed.
2. Real-Time Monitoring: The system automatically checks the status of the generation every two seconds to ensure the information on the screen is always up to date.
3. Visual Progress Tracking: As the system works, a progress bar fills up, and a countdown timer provides an estimated time to completion.
4. Stage Updates: A six-step checklist updates dynamically:

* Pending: Future steps are hidden.

* Active: The current step shows an animated spinner and an "In progress" label.

* Done: Completed steps are marked with a green checkmark.

5. Automatic Completion: Once the final step is finished and the progress reaches 100%, the system automatically redirects the user to the final document editor.

1.3 Key Concepts

- Generation Checklist: A visual roadmap consisting of six stages: Parsing, Loading, Applying, Generating, Compliance, and Finalizing.
- Progress Polling: An automated background process that refreshes the screen data every two seconds to keep the user informed.
- Dynamic ETA: A calculated countdown timer that estimates how many minutes and seconds remain until the document is ready.
- State Indicators: Visual cues (spinners for active tasks and checkmarks for completed ones) that allow users to see exactly where the system is in the workflow.

1.4 Business Value

This feature significantly improves the user experience by removing the "black box" uncertainty often associated with automated document generation. By providing clear, step-by-step feedback and an estimated completion time, users can manage their expectations and time more effectively. The automatic transition to the editor upon completion reduces manual effort and ensures a seamless workflow from document creation to final review.

2. Logic

2.1 Overview

The ICF Generation feature provides a transparent, real-time experience for users as the system creates their documents. Instead of waiting on a static loading screen, users can watch the progress of their document creation through six distinct checkpoints. Once the AI successfully completes the generation process, the system automatically transitions the user to the editing workspace to begin refining the final document.

2.2 Step-by-Step Flow

1. Initialization: As soon as the generation screen loads, the system establishes a live connection to the server to begin receiving real-time updates.
2. Progress Tracking: As the AI works, the screen updates dynamically, showing a percentage bar and highlighting which of the six generation steps is currently being processed.
3. Completion: Once the server confirms the document is fully generated, the live connection is closed.
4. Automatic Transition: After a brief pause to ensure a smooth user experience, the system automatically redirects the user to the document editor.
5. Refinement: The user arrives in the editor, where they can manually edit text, request AI-assisted rewrites, manage document sections, or view a live preview of their work.

2.3 Key Concepts

- Real-time Progress Visualization: A live status display that keeps the user informed about the generation progress, reducing uncertainty during wait times.
- Automated Workflow: A seamless transition from the generation phase to the editing phase, removing the need for the user to manually click or navigate once the document is ready.
- Document Editor: A dedicated workspace designed for post-generation refinement, offering tools for manual adjustments and AI-powered content improvements.

2.4 Business Value

This feature improves user satisfaction by replacing "black box" processing with transparent, visual feedback. By providing a clear status of the generation pipeline, users feel more in control of the process. Furthermore, the

automatic transition to the editor streamlines the workflow, allowing users to move immediately from document creation to the value-added task of refining and finalizing their content.

BUSINESS REQUIREMENTS DOCUMENT

Progress Stepper

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. Components

1.1 Overview

The Progress Stepper is a visual navigation tool located at the top of the creation screens in the BeOne platform. It provides users with a clear roadmap of the five-stage creation process, helping them understand their current progress and how much work remains. By displaying the journey from initial setup to final preview, the stepper ensures a consistent and intuitive experience as users move through the application.

1.2 Step-by-Step Flow

1. Initialization: The stepper displays five distinct stages: Setup, Generate, Edit & Refine, Review, and Preview.
2. Visual Status Update: As you move through the process, the stepper automatically updates the appearance of each stage:

* Done: Previous steps are marked with a checkmark to show they are complete.

* Active: The current step is highlighted to indicate where you are.

* Future: Upcoming steps are grayed out to show they are not yet reached.

3. Navigation Control: You can click on previous steps to return to them, provided the system has enough information (such as a saved document) to allow you to go back.
4. Transient Handling: The "Generate" step is a temporary process stage and cannot be clicked to navigate back to, ensuring the system maintains a stable workflow.

1.3 Key Concepts

- Progress Stepper: A horizontal navigation bar that tracks your location within a multi-step task.
- Active Step: The current screen you are viewing, which is visually highlighted to provide context.
- Transient Step: A specific stage in the process (the "Generate" phase) that is automated or temporary and does not support manual navigation.
- Document Dependency: A requirement where certain later stages (Edit, Review, Preview) are only accessible once a document has been successfully created and assigned an ID.

1.4 Business Value

- Improved User Experience: Reduces user frustration by providing a clear sense of direction and progress, preventing users from feeling "lost" in complex workflows.
- Reduced Training Needs: The intuitive design acts as a self-guiding interface, allowing new users to understand the platform's requirements without extensive documentation.
- Workflow Integrity: By controlling which steps are clickable based on the status of the document, the system prevents users from accessing stages before the necessary data is ready, ensuring data consistency and reducing errors.

BUSINESS REQUIREMENTS DOCUMENT

Wrapper Shell

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. components

1.1 Overview

The Wrapper Shell is a standardized layout component designed to provide a consistent user experience across the five-step "Consent Creation" process. By acting as a container for every page in this workflow, it ensures that users always have access to essential navigation tools, context about the protocol they are working on, and a clear view of their progress.

1.2 Step-by-Step Flow

1. Breadcrumb Display: The system renders a navigation bar that includes a link back to the main dashboard, the current process label ("Consent Creation"), and specific details about the protocol, such as its ID, name, and version.
2. Data Integration: The shell automatically gathers the necessary information (such as the current step number and protocol details) to ensure the interface is populated with the correct context for the user.
3. Workflow Context: The shell displays a progress indicator showing the user exactly where they are within the five-step creation flow, ensuring they always know how much of the process remains.

1.3 Key Concepts

- Wrapper Shell: A master layout that wraps around the main content of a page to provide a uniform look and feel.
- Breadcrumb Sub-bar: A navigation element that helps users understand their location within the application and provides quick access to key identifiers like the Protocol ID and ICF version.
- Step Indicator: A visual tracker that displays the user's current progress (from step 0 to 4) out of the total five steps required to complete the task.
- Conditional Rendering: A feature where specific information (like the Protocol ID or ICF name) only appears on the screen if that data is available, keeping the interface clean and uncluttered.

1.4 Business Value

- Improved User Experience: By providing a consistent "chrome" (the outer frame of the application), users can navigate the Consent Creation process intuitively without needing to relearn the interface at each step.
- Reduced Cognitive Load: Users always have immediate access to their progress and the specific protocol details they are working on, reducing the likelihood of errors or confusion.
- Development Efficiency: Because this shell is a shared component, future updates to the navigation or layout can be applied globally, ensuring the application remains maintainable and scalable as new features are added.

BUSINESS REQUIREMENTS DOCUMENT

Table of Contents

Prepared by Kolosal AI

Version 1.0	**Date** October 30, 2026	**Status** Draft	**Classification** Internal

1. components

1.1 Overview

The Table of Contents (TOC) feature provides a persistent navigation panel on the left side of the document viewer. It acts as a roadmap for the document, allowing users to quickly identify their current location and jump to specific sections. By organizing the document structure clearly and providing direct links to content, this feature improves readability and makes navigating long, complex documents much more efficient.

1.2 Step-by-Step Flow

1. Protocol Identification: At the top of the navigation panel, the system displays the unique Protocol ID in a distinct, easy-to-read badge format.
2. Section Listing: The system generates a list of all document sections.
3. Hierarchical Organization: The TOC automatically detects sub-sections (based on their numbering format) and indents them under their parent sections to create a clear visual hierarchy.
4. Active Highlighting: As the user scrolls through the document, the TOC automatically highlights the section currently being viewed, ensuring the user always knows their place.
5. Interactive Navigation: Users can click any item in the TOC to instantly scroll the main document view to that specific section.
6. Document Summary: The footer of the navigation panel provides a quick summary, including the current version of the document and the total number of sections available.

1.3 Key Concepts

- Protocol ID: A unique identifier for the document, displayed prominently to ensure users are working on the correct file.
- Hierarchical Indentation: A visual formatting style where sub-sections are slightly offset to the right, making it easier to distinguish between main topics and supporting details.
- Active State: A visual indicator (highlighting) that links the user's current scroll position in the document to the corresponding entry in the navigation menu.
- Smooth Scrolling: An interactive behavior where clicking a menu item triggers a fluid transition to the selected content, rather than an abrupt jump.

1.4 Business Value

- Improved User Efficiency: By providing a "one-click" navigation system, users spend less time scrolling through long documents to find specific information.

- Enhanced Clarity: The structured, indented layout helps users understand the document's organization at a glance, reducing cognitive load.
- Context Awareness: The active highlighting and version tracking in the footer ensure that users remain oriented and confident that they are referencing the correct version of the document.

2. LOGIC

2.1 Overview

The Table of Contents feature provides a structured way to navigate and manage document content. It acts as a dynamic sidebar that lists all sections of a document, allowing users to easily add new content areas and jump directly to specific parts of their document.

2.2 Step-by-Step Flow

1. Initial Loading: When you open a document, the system automatically retrieves the full list of existing sections, including their titles, content, and organizational order.
2. Adding a Section: When you click the "Add Section" button, the system creates a new section entry. Once created, the interface automatically selects this new section and scrolls your view directly to it so you can begin editing immediately.
3. Adding a Subsection: Similarly, when you click the "Add Subsection" button, the system creates a new subsection entry. The interface then automatically selects and scrolls to this new subsection, keeping your workflow seamless.

2.3 Key Concepts

- Section: A distinct block of content within your document that can be managed, titled, and ordered independently.
- Auto-Selection & Scrolling: A user-experience feature that ensures that whenever you create a new part of a document, the screen immediately focuses on that new area so you don't have to search for it.
- AI Labeling: A status indicator attached to sections that identifies whether the content was generated by AI or authored by a human.

2.4 Business Value

This feature significantly improves document readability and authoring efficiency. By providing a clear Table of Contents, users can maintain a high-level view of long documents, navigate complex information quickly, and add new sections without losing their place. This reduces the time spent manually scrolling and organizing content, allowing users to focus on the quality of the document itself.

3. DATA

3.1 Overview

The Table of Contents feature provides a structured, navigable sidebar for your documents. It automatically organizes the document into distinct sections, allowing users to see the document's outline at a glance and jump directly to specific parts of the content. This feature ensures that as you build or edit a document, the navigation panel stays perfectly in sync with the document's structure.

3.2 Step-by-Step Flow

1. Retrieval: When you open a document, the system fetches all associated sections, automatically arranging them in the correct order based on their position in the document.
2. Display: These sections are listed in the left-hand panel, creating a clear Table of Contents for easy navigation.
3. Creation: When you add a new section or subsection, the system automatically assigns it a default status, version, and position at the end of the document.
4. Synchronization: Whenever a new section is added, the system updates the document's "last modified" timestamp, ensuring that your document history remains accurate and up-to-date.

3.3 Key Concepts

- Section: A distinct, titled part of a document that acts as an entry in the Table of Contents.
- Positioning: The system automatically tracks the order of sections, ensuring the Table of Contents always reflects the logical flow of the document.
- Document Metadata: Background information, such as the last modified date, which is automatically updated whenever the document structure changes.
- Draft Status: New sections are created as "drafts" by default, allowing you to build out your document structure before finalizing the content.

3.4 Business Value

- Improved Navigation: Users can quickly jump to relevant information without scrolling through long documents, significantly reducing time spent searching.
- Enhanced Organization: By enforcing a structured approach to sections, the feature helps maintain consistency across all documents in the system.
- Increased Efficiency: Automated section management—such as auto-positioning and versioning—removes manual administrative tasks, allowing users to focus on the document content itself.

BUSINESS REQUIREMENTS DOCUMENT

Global Navigation Header

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. components

1.1 Overview

The Global Navigation Header is a persistent bar that sits at the top of every page within the Consent IQ platform. It serves as a consistent anchor for users, providing clear branding, quick access to important notifications, and a personalized view of their account information. By keeping this header fixed, we ensure that users always know where they are in the application and can easily manage their tasks and profile settings regardless of which page they are viewing.

1.2 Step-by-Step Flow

1. Brand Identification: The left side of the header displays the platform name ("Consent IQ"), a descriptive subtitle, and the "Powered by Agilisium" attribution to establish context and ownership.
2. Persistent Layout: The header is anchored to the top of the screen, ensuring it remains visible as the user navigates through different sections of the platform.
3. Notification Monitoring: A bell icon monitors the user's current task list. If there are pending items, a badge appears on the icon to indicate the number of unread notifications.
4. User Identity Loading: The system automatically retrieves the user's profile information, including their name and role. If the system cannot retrieve this data, it defaults to generic placeholders ("User Name" and "ICF Author") to ensure the interface remains clean and functional.

1.3 Key Concepts

- Global Header: A fixed navigation bar that remains visible across all pages to provide a consistent user experience.
- Notification Badge: A visual indicator on the bell icon that updates based on the number of active tasks, helping users stay informed about pending actions.
- User Identity: A personalized section displaying the user's name and role, represented by an avatar based on their initials for quick visual recognition.
- Fallback Logic: A safety mechanism that ensures the header displays default information if the system is unable to retrieve specific user data, preventing empty or broken UI elements.

1.4 Business Value

- Improved Navigation: By providing a consistent header, users can orient themselves quickly, reducing confusion and increasing efficiency.
- Enhanced Productivity: The notification badge acts as a proactive alert system, ensuring users are immediately aware of pending tasks that require their attention.

- Professional Branding: The clear display of the platform name and attribution reinforces the professional identity of the Consent IQ tool.
- System Reliability: The use of fallback logic ensures that the interface remains polished and professional even if there are temporary issues with data retrieval.

2. Data

2.1 Overview

The Global Navigation Header feature provides a consistent, personalized top bar across the BeOne platform. Its primary purpose is to display essential user information—such as your name, professional role, and current task status—ensuring you always know who is logged in and what requires your attention.

2.2 Step-by-Step Flow

1. Request Initiation: When you access the platform, the system automatically requests your profile information.
2. Data Retrieval: The system searches the database for your specific user profile, including your name, assigned roles, and the number of tasks currently assigned to you.
3. Validation: The system checks if your profile data is successfully found.
4. Display or Fallback:

- If your data is found, the header populates with your specific details.
- If your data is unavailable for any reason, the system displays a standard default profile (labeled as "User Name" with an "ICF Author" role) to ensure the navigation bar remains functional and professional.

2.3 Key Concepts

- User Context: The collection of personal details (name, roles, and task volume) that defines your specific session on the platform.
- Fallback Logic: A safety mechanism that ensures the navigation header displays correctly even if there is a temporary issue retrieving your specific profile data.
- Task Counts: A summary metric displayed in the header that provides a quick glance at how many items currently require your action.

2.4 Business Value

This feature enhances the user experience by providing a reliable, "always-on" orientation point. By centralizing identity and task information in the header, users can quickly verify their access level and stay informed about their

workload without navigating away from their current task. The inclusion of fallback logic ensures that the platform remains stable and usable, preventing navigation errors even during data retrieval delays.

BUSINESS REQUIREMENTS DOCUMENT

Bottom Bar - Setup

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. COMPONENTS

1.1 Overview

The "Bottom Bar - Setup" feature provides a consistent navigation and action area at the bottom of the Setup page. It is designed to guide users through the final steps of preparing an Informed Consent Form (ICF) by ensuring all necessary information is provided before starting the generation process. It also offers a simple way for users to exit the setup process and return to their main dashboard.

1.2 Step-by-Step Flow

1. Validation: The system checks that you have selected a protocol, chosen a template, and attached at least one reference document.
2. Activation: Once all three requirements are met, the "Generate ICF" button becomes active.
3. Generation: Clicking the button triggers the system to begin creating the ICF draft based on your selections.
4. Progress Tracking: The application moves to a dedicated screen that displays the real-time progress of the generation process through six sequential checkpoints.
5. Completion: Once the system finishes the generation, it automatically transitions you to the editor to review the final document.
6. Navigation: At any point during the setup, you can use the "Back to Dashboard" button to exit the current page and return to your main workspace.

1.3 Key Concepts

- Generate ICF Button: A smart action button that remains disabled until the user has provided all required inputs, preventing errors during the document creation process.
- Generation Pipeline: An automated background process that parses your selected protocol and template to build the ICF draft.
- Progress Visualization: A user-friendly display that shows exactly where the system is in the six-step generation process, providing transparency while the AI works.
- Ghost Button: A secondary navigation element used for the "Back to Dashboard" option, designed to be less prominent than the primary action button to keep the user focused on the main task.

1.4 Business Value

This feature streamlines the ICF creation workflow by enforcing data quality at the source. By requiring all necessary components (protocol, template, and references) before allowing generation, the system reduces the likelihood of errors or incomplete documents. Furthermore, the real-time progress tracking improves the user

experience by providing clear feedback during the automated generation process, ultimately saving time and increasing confidence in the final output.

2. logic

2.1 Overview

The "Generate ICF" feature allows users to initiate the creation of an Informed Consent Form (ICF) draft directly from the Setup page. By clicking a single button, the system captures the necessary protocol information, triggers a background process to analyze the document template, and prepares the data for further processing. This automation removes the need for manual document structuring, ensuring that the ICF is ready for review quickly and accurately.

2.2 Step-by-Step Flow

1. Initiation: The user clicks the "Generate ICF" button on the Setup page, which sends the relevant protocol and template information to the system.
2. Job Creation: The system creates a new background task to track the generation request and assigns it a unique identifier.
3. Document Extraction: The system automatically reads the raw text from the selected document template.
4. Logical Structuring: The system analyzes the extracted text to identify specific sections, logical structure, and key results.
5. Pipeline Handoff: Once the document is organized, the structured data is passed to the next stage of the workflow for final processing.
6. Confirmation: The system returns a confirmation to the user, providing the unique job ID and protocol ID to verify that the process has successfully started.

2.3 Key Concepts

- Informed Consent Form (ICF): A critical document that outlines the details of a study for participants; this feature automates its initial drafting.
- Background Job: A process that runs behind the scenes, allowing the system to handle complex document analysis without freezing the user interface.
- Systematic Parsing: The intelligent process of reading a document and breaking it down into organized, usable data points rather than just raw text.
- Downstream Pipeline: The subsequent stages of the software that take the organized document data and perform further actions, such as final formatting or review.

2.4 Business Value

- Efficiency: Reduces the time spent manually formatting and structuring consent forms, allowing staff to focus on higher-value tasks.
- Consistency: Ensures that every ICF is parsed and structured using the same logical rules, reducing the risk of human error.
- Scalability: By automating the document intake process, the system can handle a higher volume of protocol setups without requiring additional manual oversight.

3. Data

3.1 Overview

The "Setup" bottom action bar feature introduces a streamlined way for users to initiate data generation tasks. When a user triggers a generation request from the Setup page, the system immediately acknowledges the request, creates a tracking record, and provides a unique reference so the user can monitor the progress of their task in real-time.

3.2 Step-by-Step Flow

1. Request Initiation: The user triggers a generation request from the Setup page.
2. Validation: The system checks that all necessary information (specifically the protocol identifier) is present and valid. If information is missing, the system alerts the user that the request cannot be processed.
3. Task Creation: Once validated, the system creates a new "pending" job record in the background to track the work.
4. Confirmation: The system sends an immediate confirmation back to the interface, providing a unique Job ID and echoing the Protocol ID to confirm exactly what is being processed.
5. Live Monitoring: The system uses the provided Job ID to open a live connection, allowing the interface to receive real-time updates as the generation task progresses.

3.3 Key Concepts

- Job ID: A unique digital fingerprint assigned to every generation request, allowing the system to track and report on that specific task.
- Protocol ID: A reference label that identifies the specific set of instructions or parameters the system should use for the generation task.

- Pending Status: The initial state of a task, indicating that the system has successfully received the request and is preparing to start the work.
- Real-time Stream: A live communication channel between the server and the user's screen, ensuring the user sees progress updates as they happen without needing to refresh the page.

3.4 Business Value

This feature improves the user experience by providing immediate feedback when a task is started. By confirming the request and establishing a live connection, users are never left wondering if their action was successful. This transparency reduces uncertainty and allows users to manage their workflow efficiently while the system handles complex generation tasks in the background.

BUSINESS REQUIREMENTS DOCUMENT

Bottom Bar - Review

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. Components

1.1 Overview

The "Bottom Bar - Review" feature provides a persistent navigation area at the bottom of the document review screen. It is designed to give users clear options for finalizing their work or returning to previous steps, ensuring they have full control over the document submission process before moving to the final preview stage.

1.2 Step-by-Step Flow

1. Reviewing the Document: The user is on the Review page, where they can see the current status of their document.
2. Submitting for Approval: The user clicks the "Submit for Approval" button. If there are outstanding comments on the document, the button label will dynamically display the number of open comments to alert the user.
3. Validation: Upon clicking submit, the system checks if the document meets all necessary requirements. If the requirements are not met, the submission is blocked.
4. Finalizing: If the document passes all checks, its status is updated to "Approved," and the user is automatically taken to the Preview page.
5. Returning to Edit: If the user decides the document needs more work, they can click the "Back to Edit" button at any time to return to the editing screen to make further refinements.

1.3 Key Concepts

- Dynamic Labeling: A smart interface feature that updates the button text based on the document's current state (specifically highlighting open comments) to help users make informed decisions.
- Gate Conditions: A background validation process that ensures a document is complete and error-free before it can be officially submitted for approval.
- Status Update: The automated transition of a document's lifecycle state from "Draft" or "Review" to "Approved" once it successfully passes validation.

1.4 Business Value

This feature streamlines the document workflow by providing clear, actionable paths for the user. By surfacing the number of open comments directly on the submission button, it reduces the risk of submitting incomplete work. Furthermore, the automated validation process ensures that only high-quality, compliant documents reach the approval stage, saving time for both the user and the review team.

2. Logic

2.1 Overview

The "Review" bottom action bar feature provides a streamlined way for users to finalize their work on the document review page. It automates the transition from reviewing a document to officially approving it and generating a final preview, ensuring that all necessary requirements are met before the document is locked and published.

2.2 Step-by-Step Flow

1. Submission: When the user clicks the approval button, the system first checks that all required fields are filled and any outstanding comments are addressed.
2. Validation: If the document meets all necessary criteria, the system updates the document status to "Approved." If requirements are not met, the user is notified that the document cannot be submitted yet.
3. Navigation: Upon successful approval, the system automatically redirects the user to the Preview page.
4. Finalization: The Preview page retrieves the document data to display a simulated PDF version and automatically publishes the final version of the document.

2.3 Key Concepts

- Gate Conditions: A set of mandatory checks (such as completing required fields) that must be satisfied before a document can be moved to the next stage.
- Document Approval: The formal process of marking a document as complete, which triggers the transition from a draft state to a finalized state.
- Simulated PDF Preview: A view that allows the user to see exactly how the final document will appear before it is officially published.
- Publishing: The final action that locks the document version, making it ready for its intended use.

2.4 Business Value

This feature reduces manual effort and minimizes errors by automating the transition between reviewing and finalizing documents. By enforcing "gate conditions," the system ensures that no document is approved prematurely, maintaining high data quality and compliance. Furthermore, the seamless transition to the preview and publishing stage saves time for the user, providing immediate confirmation that their work has been successfully processed.

BUSINESS REQUIREMENTS DOCUMENT

Bottom Bar - Edit

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. components

1.1 Overview

The "Bottom Action Bar" is a navigation and control component located at the bottom of the "Edit and Refine" page. It provides users with clear options to either finalize their work by submitting it for review or to return to the initial setup phase if further adjustments are needed.

1.2 Step-by-Step Flow

1. Submit for Review: When the user clicks the "Submit for Review" button, the system sends the document to be processed.
2. Status Update: Upon a successful submission, the document's status is automatically updated to "In Review."
3. Navigation to Review: Once the status is updated, the user is automatically redirected to the "ICF Review" page to view the document in its new state.
4. Error Handling: If the submission fails due to a system error or invalid document data, the user is notified with an error message.
5. Back to Setup: If the user clicks the "Back to Setup" button, they are immediately navigated back to the "ICF Creation - Setup" page to modify their protocol or configuration settings.

1.3 Key Concepts

- Submit for Review: A primary action that triggers the transition of a document from a draft state to an "In Review" state.
- Back to Setup: A secondary navigation action that allows users to exit the editing process and return to the configuration wizard.
- Ghost Button: A visual style used for the "Back to Setup" button to indicate it is a secondary action, keeping the focus on the primary "Submit" button.
- Status Transition: The automated process where the system changes the document's internal status based on user interaction.

1.4 Business Value

This feature streamlines the document workflow by providing immediate, context-aware actions. By placing these controls at the bottom of the screen, users can easily transition between editing, reviewing, and setup phases without searching for navigation options. This reduces friction in the document creation process and ensures that document statuses are updated accurately and automatically, minimizing manual administrative tasks.

2. logic

2.1 Overview

The "Submit for Review" feature provides a simple, one-click action on the Edit and Refine page that allows users to finalize their work and move a document into the formal review process. This ensures that once a user is satisfied with their edits, they can easily signal to the system that the document is ready for the next stage of the workflow.

2.2 Step-by-Step Flow

1. The user clicks the "Submit for Review" button located in the bottom navigation bar.
2. The system receives the request and identifies the specific document being edited.
3. The system automatically updates the document's status to "In Review."
4. The system confirms the update is successful, signaling that the document has been moved out of the editing phase.
5. If the document cannot be located, the system will notify the user that the action could not be completed.

2.3 Key Concepts

- Submit for Review: A trigger action that transitions a document from an "Editing" state to an "In Review" state.
- Document Status: A tracking label that tells the system and other users exactly where a document is in its lifecycle.
- In Review: The designated status that indicates a document is no longer being actively edited and is awaiting further action or approval.

2.4 Business Value

This feature streamlines the transition between editing and approval, reducing manual administrative work. By automating the status update, it ensures that document tracking remains accurate and that stakeholders are immediately aware when a document is ready for their attention, ultimately speeding up the overall review cycle.

3. Data

3.1 Overview

The "Bottom Bar - Edit" feature provides a streamlined way for users to finalize their work on the "Edit and Refine" page. When a user is satisfied with their document, they can trigger a submission process directly from the bottom action bar. This action officially moves the document into the review cycle, ensuring that the system tracks the document's progress and maintains an accurate audit trail.

3.2 Step-by-Step Flow

1. The user initiates the submission process from the bottom action bar on the document editing page.
2. The system locates the specific document being edited using its unique identifier.
3. The system verifies that the document is eligible for submission (e.g., ensuring it hasn't already been archived).
4. The document's status is updated to "In Review" to reflect that it is ready for approval.
5. The system records the exact time of this update to keep the document's history current.
6. An audit log entry is automatically created to document the status change for compliance and tracking purposes.

3.3 Key Concepts

- Status Update: The process of changing a document's state from "Draft" (or similar) to "In Review," signaling that the editing phase is complete.
- Audit Log: A secure, chronological record of changes made to a document, which provides transparency and accountability for all status transitions.
- Validation: A safety check performed by the system to ensure that a document is in a valid state before allowing it to move to the review stage.
- Last Modified Timestamp: A system-generated record that tracks the most recent time a document was updated, ensuring users always know when the latest change occurred.

3.4 Business Value

This feature simplifies the transition from document creation to the approval process. By automating the status update and audit logging, it reduces manual administrative work, minimizes the risk of human error, and ensures that all stakeholders have clear visibility into which documents are ready for review. This creates a more efficient and reliable workflow for managing document lifecycles.

BUSINESS REQUIREMENTS DOCUMENT

Bottom Bar - Generate

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. COMPONENTS

1.1 Overview

The "Generate" page features a bottom navigation bar designed to give users flexibility while they are in the process of creating content. This bar provides two clear paths for users to exit the current generation screen, depending on whether they want to restart their configuration or move forward to the editing phase.

1.2 Step-by-Step Flow

1. Back to Setup: If a user decides they need to change their initial configuration, they can select the "Back to Setup" button. This immediately returns them to the creation screen.
2. Skip: If a user prefers to bypass the current generation process and move directly to the editing stage, they can select the "Skip" button. The system verifies the current job information and then transitions the user to the editor for that specific task.

1.3 Key Concepts

- Ghost Button: A secondary button style that is visually subtle, ensuring the primary action on the page remains the focus while still providing clear navigation options.
- Navigation Logic: The system ensures that the "Skip" function only works if a valid job is currently active, preventing errors if the system cannot identify which task the user is trying to edit.
- Flexible Workflow: The ability to either return to the beginning or jump ahead allows users to control their own pace and correct mistakes without being forced to complete the current step.

1.4 Business Value

This feature improves the user experience by reducing frustration. By providing an "escape hatch" to return to the setup phase, users can easily correct errors. By providing a "Skip" option, power users or those who have already configured their settings can move through the application more efficiently, ultimately increasing the speed at which they can reach the final editing stage.

BUSINESS REQUIREMENTS DOCUMENT

AI Document Parser

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. LOGIC

1.1 Overview

The AI Document Parser is an automated system designed to streamline the creation of Informed Consent Forms (ICFs). By combining a standardized document template with specific clinical protocol details, the system uses artificial intelligence to extract relevant information and populate the form automatically. This reduces manual drafting time while ensuring that complex clinical information is translated into clear, participant-friendly language.

1.2 Step-by-Step Flow

1. Template Selection: The system retrieves the requested ICF template and breaks it down into distinct sections and specific placeholders that need to be filled.
2. Protocol Retrieval: The system locates the corresponding clinical protocol document (PDF) required for the specific study.
3. Text Extraction: The system converts the PDF into raw text so the information can be processed.
4. Skeleton Mapping: The system organizes the template's placeholders, mapping each one to the specific section of the document where it belongs. This provides the AI with the necessary context to understand what information is needed for each part of the form.
5. AI Processing: The system sends the protocol text and the template requirements to an AI model. The AI extracts the relevant data and formats it into a structured list. If the AI's initial response is formatted incorrectly, the system automatically retries once to ensure accuracy.
6. Form Population: The system inserts the extracted information into the template. If any information is missing from the source document, the system inserts a clear placeholder note so a human reviewer knows exactly what needs to be completed.
7. Artifact Storage: The final document, the underlying data structure, and the extraction results are saved to the system for review and future use.
8. Unique Identification: The system assigns a unique, standardized ID to the newly generated document for tracking and record-keeping purposes.

1.3 Key Concepts

- ICF (Informed Consent Form): The document provided to study participants that explains the risks, benefits, and procedures of a clinical trial.
- Template: A pre-defined document structure containing placeholders that act as "fill-in-the-blank" fields.
- Protocol: The official document detailing the clinical study's design, objectives, and procedures.
- Placeholder: A specific tag in the template (e.g., {{Study_Duration}}) that the AI identifies and replaces with actual data from the protocol.

- Artifacts: The final files generated by the process, including the completed document and the supporting data used to create it.

1.4 Business Value

- Efficiency: Significantly reduces the time required to draft complex consent forms by automating the extraction of data from lengthy clinical protocols.
- Consistency: Ensures that all ICFs follow a standardized format and tone, reducing the risk of human error or omission.
- Clarity: The AI is instructed to use plain, natural language, which improves participant comprehension and ensures the consent process is more accessible.
- Auditability: By saving the extraction results and the document structure alongside the final form, the system provides a clear trail of how the information was derived, supporting compliance and quality assurance.

BUSINESS REQUIREMENTS DOCUMENT

AI Openrouter SDK

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. FRONTEND

1.1 Overview

The AI OpenRouter SDK feature enables users to upload documents and receive intelligent, AI-driven revisions. By combining the document's content with specific user instructions, the system can perform targeted edits, making it easier to refine and update complex documents without manual rewriting.

1.2 Step-by-Step Flow

1. Document Parsing: The system takes your uploaded file, extracts the raw text, and organizes it into logical sections so the AI can understand the document's structure.
2. Instruction Input: You select a specific section of the document you wish to change and provide a clear instruction (e.g., "make this paragraph more professional" or "summarize these findings").
3. AI Processing: The system sends your selected text and your instructions to the AI engine.
4. Revision Generation: The AI processes the request and returns a revised version of the text based on your specific guidance.

1.3 Key Concepts

- Document Parsing: The process of reading a file and breaking it down into manageable parts so the AI can accurately identify context.
- User Prompt: The specific instructions or feedback you provide to guide the AI on how to modify the text.
- AI Revision: The use of advanced language models to rewrite or improve content based on the provided context and user requirements.

1.4 Business Value

This feature significantly reduces the time and effort required for document editing and content refinement. By automating the revision process, users can ensure consistency and quality in their documentation while focusing on high-level strategy rather than manual word-smithing. It transforms static documents into dynamic assets that can be easily updated and improved through simple natural language instructions.

2. LOGIC

2.1 Overview

The AI OpenRouter SDK feature enables our system to automatically process and summarize complex documents. By connecting to advanced AI models through a centralized service, the system can break down large files into

logical sections and generate intelligent summaries or insights based on specific user instructions. This allows for faster document analysis and consistent output quality across various file types.

2.2 Step-by-Step Flow

1. Document Preparation: The system receives the raw document and breaks it down into smaller, logical sections to ensure the AI can process the information accurately.
2. File Encoding: The document is converted into a digital format that the AI service can read and interpret securely.
3. AI Connection: The system establishes a secure connection to the OpenRouter platform, which acts as a gateway to powerful AI models.
4. Instruction Processing: For each section of the document, the system sends the file content along with your specific instructions to the AI model.
5. Summary Extraction: The AI analyzes the section based on your request and returns a concise summary.
6. Data Storage: Once all sections are processed, the system saves the generated summaries into our database for future use or review.

2.3 Key Concepts

- Document Chunking: The process of dividing a long document into smaller, manageable parts so the AI can focus on specific topics without losing context.
- OpenRouter: A service that allows our software to access various high-performance AI models through a single, unified connection.
- Base64 Encoding: A method of converting a file (like a PDF) into a text-based format so it can be easily transmitted to the AI service.
- Instruction-Based Processing: The ability for the user to provide specific guidance (e.g., "summarize for a manager" or "extract key dates") that the AI follows for every section of the document.

2.4 Business Value

- Efficiency: Automates the time-consuming task of reading and summarizing lengthy documents, allowing staff to focus on higher-value analysis.
- Consistency: Ensures that every document is processed using the same logic and instructions, reducing human error and variability.
- Scalability: By using a flexible AI gateway, the system can easily adapt to different AI models as technology improves, ensuring we always have access to the best tools for the job.
-

Actionable Insights: Transforms static documents into structured, summarized data that is easier to search, store, and act upon.

3. DATA

3.1 Overview

The AI Openrouter SDK feature is designed to automate the creation and storage of structured documents. By leveraging AI, the system takes raw input data and a specific template to generate a finalized document. This feature ensures that the resulting document—along with its individual sections—is accurately saved and organized in our database for future retrieval and use.

3.2 Step-by-Step Flow

1. Document Creation: The system receives the processed output from the AI generation process. It captures essential details such as the template used, the source file name, the AI model version, the input values, the final formatted text, and the document's structure.
2. Data Persistence: The system creates a unique record for the new document in the database, including a timestamp of when it was generated.
3. Section Breakdown: Once the main document record is established, the system processes the individual components (sections) of the document.
4. Linking and Storage: Each section—consisting of a title and its corresponding content—is saved to the database and linked back to the parent document, ensuring the document remains organized and easy to navigate.

3.3 Key Concepts

- Document Generation: The process of combining user-provided data with a template to produce a finished, formatted document.
- Persistence: The act of saving data into the system's permanent storage (database) so that it is not lost when the session ends.
- Document Sections: The individual parts of a document (e.g., chapters or headers) that are stored separately to allow for better organization and easier editing.
- Unique Identifier: A system-generated reference code assigned to every document to ensure it can be uniquely identified and linked to its specific sections.

3.4 Business Value

-

Efficiency: Automates the manual effort of drafting and organizing complex documents, significantly reducing turnaround time.

- Consistency: Ensures that every document generated follows the same structural standards and template requirements.
- Data Integrity: By automatically linking sections to their parent documents, the system maintains a clean, organized record-keeping process, making it easier to audit or retrieve specific information later.

BUSINESS REQUIREMENTS DOCUMENT

AI Document Editor

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. COMPONENTS

1.1 Overview

The AI Document Editor is a tool designed to help you refine and polish document content directly within the "Edit and Refine" page. It acts as an intelligent writing assistant, allowing you to select specific sections of a document and provide instructions—such as simplifying language or summarizing key points—to automatically update the text.

1.2 Step-by-Step Flow

1. Select Section: You begin by viewing the document section you wish to edit. The content is displayed in an editable text box, allowing you to make manual changes or review the text before applying AI improvements.
2. Choose a Quick Prompt: To save time, you can select from pre-defined buttons (such as "Simplify language for patient readability") which automatically populate your instruction.
3. Add Custom Instructions: If you have a specific request, you can type your own instructions into the text box provided.
4. Ask AI: Once your instruction is ready, click the "Ask AI" button. The system will process your request, update the document section with the AI-generated improvements, and provide visual feedback while it works.

1.3 Key Concepts

- Section Context: The specific portion of the document the AI is currently focused on, ensuring that edits are relevant and targeted.
- Quick Prompts: Shortcut buttons that provide common editing commands, helping you achieve consistent results without needing to type out instructions.
- Instruction Textarea: A flexible input field where you can provide natural-language guidance to the AI, such as asking for a tone change or a compliance check.
- Processing State: A visual indicator that lets you know the AI is currently working on your request, preventing duplicate actions while the document is being updated.

1.4 Business Value

This feature significantly reduces the time and effort required to draft and refine professional documents. By providing both quick-access shortcuts and the ability to give custom instructions, it empowers users to maintain high-quality, readable, and compliant content with minimal manual effort. It bridges the gap between complex technical documentation and clear, patient-friendly communication.

2. Logic

2.1 Overview

The AI Document Editor feature allows users to refine specific sections of a document using natural language instructions. By selecting a section and providing a prompt (such as "make this more concise" or "adjust the tone to be more professional"), the system leverages AI to rewrite the content while maintaining the document's structure and tracking the history of the changes.

2.2 Step-by-Step Flow

1. Instruction Selection: The user selects a specific section of the document and provides a written instruction (prompt) describing how they would like that section modified.
2. Content Processing: The system combines the existing section text with the user's instructions and sends them to the AI engine.
3. AI Revision: The AI processes the request and generates a revised version of the section based on the provided instructions.
4. System Update: The system automatically updates the document with the new content, marks the section as "AI Edited," updates its status to "AI Generated," and increments the version number to ensure a clear audit trail.

2.3 Key Concepts

- Prompt: The natural language instruction provided by the user to guide the AI on how to rewrite or refine the selected text.
- Section Context: The specific portion of the document being targeted for editing, which serves as the foundation for the AI's work.
- Provenance Tag: A label (e.g., "AI Edited") attached to the section that identifies the origin of the content, ensuring transparency in how the document was created.
- Version Control: An automated tracking mechanism that increments the version number each time an AI edit is applied, allowing users to keep track of changes over time.

2.4 Business Value

This feature significantly reduces the time and effort required for document drafting and refinement. By allowing users to apply targeted AI edits to specific sections, the tool ensures high-quality, consistent documentation while maintaining full control over the final output. The automated status and version tracking provide peace of mind by ensuring that all AI-assisted changes are clearly documented and easily manageable within the broader workflow.

3. Data

3.1 Overview

The AI Document Editor feature provides a structured way to manage and track changes made to document sections by artificial intelligence. It ensures that every piece of content generated or refined by the AI is properly labeled, tracked for version history, and assigned a specific status within the document workflow. This allows users to maintain full oversight of AI-assisted content while ensuring the document remains organized and accurate.

3.2 Step-by-Step Flow

1. Data Receipt: The system receives a structured update containing the revised content for a specific section of a document.
2. Validation: The system checks the incoming data to ensure all required information is present, such as the section title, the current version number, and the specific status of the content.
3. Constraint Checking: The system verifies that the data meets business rules, such as ensuring the section position is valid and the version number is current.
4. Categorization: The system assigns a "provenance tag" to the content, identifying whether it was generated, edited, or revised by the AI, or if it was manually created.
5. Persistence: Once validated, the updated section is saved to the document, keeping the document's structure and history intact.

3.3 Key Concepts

- Provenance Tag: A label that clearly identifies the origin of the content (e.g., whether it was created by AI or a human), providing transparency into how the text was produced.
- Workflow Status: A tracking mechanism that indicates the current state of a section, such as whether it is a "Draft," "Needs Review," or "Approved."
- Version Control: A counter that tracks the number of revisions made to a section, ensuring that users can always identify the most recent update.
- Section Positioning: A numerical index that determines the order of the content within the document, ensuring that sections appear in the correct sequence.

3.4 Business Value

This feature brings transparency and reliability to AI-assisted document creation. By clearly labeling AI contributions and tracking the status of every section, teams can confidently use AI to draft or refine documents while maintaining a clear audit trail. This reduces the risk of errors, simplifies the review process, and ensures that all document changes are accounted for and properly managed within the existing workflow.

BUSINESS REQUIREMENTS DOCUMENT

Edit Actions

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. COMPONENTS

1.1 Overview

The "Edit Actions" feature provides a centralized control bar for managing document content within the BeOne platform. It allows users to view document metadata, preview the final layout, and perform direct edits or deletions on specific sections of a document. This interface ensures that users have clear visibility into what they are working on and provides safe, controlled ways to modify document content.

1.2 Step-by-Step Flow

1. Context Display: Upon loading, the system displays the document name and identification number at the top of the screen to provide immediate context.
2. Section Selection: The interface identifies and displays the title of the specific section currently selected by the user.
3. Previewing: Users can click "Preview Draft" to open a full-screen modal that displays the document as a PDF, allowing for a final review of the layout.
4. Version Awareness: A version label (e.g., "v1.0 Draft") is always visible, ensuring users know exactly which iteration of the document they are viewing.
5. Editing Content: Clicking "Edit" transforms the section into an editable text area. Users can then modify the content and choose to "Save" their changes (which updates the system) or "Cancel" to discard them.
6. Deleting Content: Clicking "Delete" triggers a confirmation prompt to prevent accidental data loss. Once confirmed, the section is permanently removed, and the document structure is automatically updated.

1.3 Key Concepts

- Document Context Bar: A persistent header that displays essential information like the document name, version, and the specific section being edited.
- Preview Modal: A dedicated, full-screen view that allows users to see how their changes appear in the final document format before finalizing them.
- Edit Mode: A state-based interface that switches a section from a read-only view to an interactive text editor, providing clear "Save" and "Cancel" options.
- Delete Confirmation: A safety mechanism that requires an extra step before permanently removing a section to ensure data integrity.

1.4 Business Value

This feature streamlines the document refinement process by placing all necessary management tools directly within the user's workflow. By providing real-time previewing and clear editing controls, it reduces the risk of errors and improves efficiency. Furthermore, the system automatically logs manual edits and manages document structure during deletions, ensuring that the document remains audit-ready and organized at all times.

2. logic

2.1 Overview

The Edit Actions feature provides users with the necessary tools to manage document content directly within the "Edit and Refine" page. This functionality allows users to view document details, modify specific sections of text, and remove unwanted sections, ensuring the document remains accurate and well-structured throughout the editing process.

2.2 Step-by-Step Flow

1. Document Initialization: When a user opens a document, the system automatically generates a unique identifier for the document to ensure it is tracked correctly.
2. Loading Content: The system retrieves the full document, including its metadata, status, and all existing sections, and displays them in the center panel for the user to review.
3. Editing Content: When a user makes changes to a specific section, the system saves those updates immediately. It also creates an activity log entry to track that a manual edit has occurred.
4. Removing Content: If a user chooses to delete a section, the system removes it permanently. Once deleted, the system automatically reorganizes the remaining sections to ensure the document structure stays consistent and properly ordered.

2.3 Key Concepts

- Document Metadata: The background information associated with a document, such as its name, version, status, and creation dates, which helps users identify and track the document's history.
- Section Editing: The ability to modify the text within a specific part of a document without needing to rewrite the entire file.
- Activity Logging: An automated record-keeping process that tracks when changes are made, providing transparency and accountability for document updates.
- Structural Re-sequencing: An automated cleanup process that ensures that after a section is removed, the remaining parts of the document are correctly ordered and formatted.

2.4 Business Value

This feature streamlines the document management workflow by providing a centralized, intuitive interface for refining content. By automating the tracking of edits and the reorganization of document structure, the system reduces the risk of manual errors, saves time for the user, and ensures that all document versions remain organized and audit-ready.

3. data

3.1 Overview

The Edit Actions feature provides a centralized control bar within the "Edit and Refine" page, allowing users to manage document content efficiently. It enables users to view document details, modify specific sections of text, and remove sections when they are no longer needed. The system ensures that all changes are tracked for audit purposes and that the document structure remains organized automatically.

3.2 Step-by-Step Flow

1. Document Retrieval: When you open a document, the system loads the full document, including its metadata (such as the name, version, and status) and its current content.
2. Section Modification: When you edit a specific section of the document, the system saves your changes and automatically creates an activity log entry to record that a manual edit has occurred.
3. Section Removal: If you choose to delete a section, the system permanently removes it from the document.
4. Automatic Re-sequencing: Immediately after a section is deleted, the system automatically updates the order of the remaining sections to ensure the document structure remains clean and sequential.

3.3 Key Concepts

- Document Metadata: The descriptive information about a document, such as its protocol ID, version number, and current status, which helps identify and track the file.
- Activity Log: A background record that tracks manual edits, providing an audit trail of changes made to the document content.
- Section Re-sequencing: An automated process that adjusts the numbering or order of document parts after a deletion, ensuring there are no gaps in the document flow.
- Edit and Refine Page: The primary workspace where users interact with the document to make content adjustments and manage its structure.

3.4 Business Value

This feature streamlines the document management process by providing a reliable, user-friendly interface for content updates. By automating the re-sequencing of sections and maintaining an audit log of all edits, the system

reduces the risk of manual errors, ensures document integrity, and provides transparency for compliance and review purposes.

BUSINESS REQUIREMENTS DOCUMENT

Review Actions

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. COMPONENTS

1.1 Overview

The Review Actions bar is a navigation and utility tool located at the top of the document review page. Its primary purpose is to provide clear context about the document you are currently viewing and to offer a simple way to compare different versions of that document side-by-side. This ensures that reviewers always have the necessary information at their fingertips to make informed decisions during the document lifecycle.

1.2 Step-by-Step Flow

1. Document Identification: The bar displays the document name and its unique identification number (ICF ID) so you can immediately confirm which file is open.
2. Version Awareness: The current version of the document (e.g., "v1.0 Draft") is clearly displayed, ensuring you are aware of the specific iteration you are reviewing.
3. Version Comparison: By clicking the "Compare Versions" button, the system retrieves a list of all available versions for that document. You can select any previous or alternative version from the dropdown menu to open it alongside your current view for a direct comparison.

1.3 Key Concepts

- ICF ID: A unique identifier for the Informed Consent Form, used to ensure accuracy and traceability across different document versions.
- Version Label: A status indicator that tells you exactly which stage of the document lifecycle you are looking at, such as a draft or a finalized version.
- Side-by-Side Comparison: A feature that allows you to view two different versions of a document simultaneously, making it easier to spot changes, updates, or discrepancies.

1.4 Business Value

This feature streamlines the review process by eliminating the need to manually search for document history or toggle between different browser tabs. By providing instant access to version history and comparison tools, it reduces the risk of human error, saves time for reviewers, and ensures that the most current and accurate information is always being used for compliance and decision-making.

2. Logic

2.1 Overview

The Review Actions feature allows users to easily compare different iterations of a document. By selecting a document, the system automatically retrieves a complete history of its versions, enabling users to see how the content has evolved over time and identify which version is currently active.

2.2 Step-by-Step Flow

1. The user initiates the "Compare Versions" action from the document review page.
2. The system identifies the specific document and requests its full version history.
3. The system retrieves the list of all available versions, including their labels, current status, and whether they are the active version.
4. This information is sent back to the interface to populate a dropdown menu, allowing the user to select and compare specific versions.
5. If no versions are found, the system displays an empty list; if an error occurs during the request, the system notifies the user that the information could not be retrieved.

2.3 Key Concepts

- Version History: A chronological list of all saved iterations of a document, allowing for easy tracking of changes.
- Active Version: The current, primary version of the document that is officially in use or under review.
- Version Status: The current state of a specific document iteration (e.g., draft, pending, or finalized).

2.4 Business Value

This feature streamlines the review process by eliminating the need to manually search for document updates. By providing a clear, accessible list of versions, it ensures that stakeholders are always reviewing the correct information, reduces the risk of working on outdated drafts, and improves overall document governance and transparency.

BUSINESS REQUIREMENTS DOCUMENT

Comment Actions

Prepared by Kolosal AI

Version 1.0 **Date** October 30, 2026 **Status** Draft **Classification** Internal

1. components

1.1 Overview

The "Comments-Actions" feature provides a collaborative workspace on the document review page. It allows reviewers to communicate via threaded comments and ensures that a document cannot be submitted for final approval until all feedback has been addressed and all reviewers have completed their required actions.

1.2 Step-by-Step Flow

1. Reviewer Participation: Reviewers can view their status and confirm their participation by clicking an "Act" button, which updates their status to "acted."
2. Comment Management: Users can view existing feedback in a scrollable list on the right-hand panel.
3. Adding Feedback: Users can add new comments using a pinned composer at the bottom of the panel. When typing, they can associate the comment with a specific section of the document.
4. Validation Check: The system continuously monitors two conditions: whether all reviewers have "acted" and whether there are any remaining "open" comments.
5. Submission: Once all reviewers have acted and all comments are resolved (zero open comments), the "Submit for Approval" button becomes active, allowing the document to move to the next stage.

1.3 Key Concepts

- Approval Gate: A safety mechanism that prevents a document from being submitted until all reviewers have finished their tasks and all feedback has been addressed.
- Comment Composer: A dedicated input area that allows users to attach feedback to specific parts of the document, ensuring context is preserved.
- Threaded Comments: A structured way to view feedback, including replies, to keep discussions organized and easy to follow.
- Action Status: A tracking system that monitors whether each reviewer has officially acknowledged or completed their review responsibilities.

1.4 Business Value

This feature streamlines the document review process by centralizing communication and enforcing quality control. By requiring all comments to be resolved before submission, the system reduces the risk of oversight and ensures that every piece of feedback is accounted for. This creates a more disciplined, transparent, and efficient workflow for teams managing complex documentation.

2. Logic

2.1 Overview

The Comment Actions feature provides a dedicated space on the document review page for users to communicate and track feedback. This feature allows reviewers to view existing discussions, add new comments or replies, and formally signal that they have completed their review actions. By centralizing these interactions, the system ensures that all feedback is captured directly alongside the document being reviewed.

2.2 Step-by-Step Flow

1. Reviewer Action: When a user clicks the "Act" button, the system updates their status to confirm they have performed their required review task.
2. Loading Comments: When the Comments tab is opened, the system automatically retrieves all existing comments and replies associated with that specific document.
3. Adding Feedback: When a user submits a new comment or a reply, the system validates the input and saves it to the document's history, making it immediately available for others to see.
4. Cleanup: When the user navigates away from the comments section, the system clears the temporary data to ensure that the next time the tab is opened, the information is fresh and accurate.

2.3 Key Concepts

- Reviewer Status: A tracking mechanism that records whether a participant has officially completed their review action.
- Comment Threading: The ability to view both original comments and their subsequent replies in a single, organized view.
- Data Persistence: The process of saving comments and review actions to the system so they remain available for future reference.
- State Management: The system's way of handling information locally while a user is viewing the page, ensuring that data is cleared when no longer needed to prevent errors.

2.4 Business Value

This feature streamlines the collaboration process by removing the need for external communication tools. By linking comments directly to specific sections of a document and tracking reviewer progress, teams can achieve faster turnaround times, maintain a clear audit trail of feedback, and ensure that all stakeholders are aligned before a document is finalized.

3. Data

3.1 Overview

The Comment Actions feature provides a dedicated space within the document review page for users to communicate and track feedback. Located in a right-hand panel, this feature allows reviewers to post comments, reply to existing discussions, and manage the status of their feedback. Additionally, the system tracks whether a reviewer has completed their required actions on a document, ensuring clear visibility into the review progress.

3.2 Step-by-Step Flow

1. Viewing Feedback: When a user opens a document, the system automatically retrieves all existing comments and replies associated with that specific document, displaying them in chronological order.
2. Adding Comments: A user can create a new comment or reply to an existing one. The system validates that the comment contains text and assigns it a status (such as open, resolved, or closed).
3. Saving Feedback: Once validated, the new comment is saved with a unique identifier and a timestamp, then immediately displayed in the interface to keep all reviewers updated in real-time.
4. Updating Review Status: As a reviewer interacts with the document, the system tracks their participation. Once a reviewer performs an action, their status is updated in the system to reflect that they have officially "acted" on the document.

3.3 Key Concepts

- Comment Threading: The ability to link replies to a parent comment, allowing for organized, multi-turn conversations within the document.
- Comment Status: A tracking mechanism (Open, Resolved, or Closed) that helps teams manage the lifecycle of a piece of feedback.
- Reviewer Action Tracking: A status flag that confirms whether a specific reviewer has completed their required tasks, providing transparency for project managers.
- Chronological Sorting: Comments are automatically ordered by the time they were created to ensure the conversation flow is easy to follow.

3.4 Business Value

This feature streamlines the collaboration process by centralizing communication directly alongside the document being reviewed. By providing a clear status for both individual comments and the reviewer's overall progress, it reduces ambiguity, prevents feedback from being overlooked, and ensures that all stakeholders remain aligned on the document's approval status.

1. Frontend

1.1 Overview

The Profile Section feature allows users to view and update their first name within the application. It ensures that user information is always accurate and up-to-date by pulling data directly from the user's profile and providing a secure way to modify it.

1.2 Step-by-Step Flow

1. Data Loading: When the page loads, the system automatically retrieves the user's current first name from their profile.
2. View Mode: By default, the name is displayed in a read-only format to prevent accidental changes.
3. Initiating Edit: When the user clicks the "Edit" button, the field becomes active, allowing them to type a new name.
4. Real-time Validation: As the user types, the system checks the input to ensure it is not empty and contains only valid characters (letters and spaces). If the input is invalid, an error message appears immediately.
5. Saving Changes: Once the user clicks "Save," the system performs a final validation check. If everything is correct, the new name is sent to the server to update the user's profile, and the field returns to read-only mode.

1.3 Key Concepts

- Read-Only State: A security and usability feature that prevents accidental edits by locking the text field until the user explicitly chooses to change it.
- Input Validation: A quality control process that ensures the data entered by the user meets specific requirements (not empty and correct format) before it is accepted by the system.
- Authenticated Profile: The secure source of truth for user information, ensuring that the name displayed belongs to the person currently logged into the account.

1.4 Business Value

This feature empowers users to maintain their own account information, reducing the need for manual support requests to update basic profile details. By implementing strict validation, the system ensures data integrity, preventing errors or invalid characters from being saved to the user database.
